growth characteristics of a plant, useful for a wide application in icultural and horticultural practices, and in vitro plant cell and New isolated GREP nucleic acids and polypeptides controlling

The invention relates to a new isolated mucleic acid encoding a growth regulating protein (GREP), where the protein conforms to the GREP regulating protein (GREP), where the protein conforms to the GREP conclains. Also included are a vector comprising a RREP mucleic acid, or a vector alpha) where the growth regulating polypeptide OsPSK (phytosulphokinedalpha) where the growth regulating polypeptide OsPSK (phytosulphokinedalpha) where the growth regulating proteins regulate growth and/or alpha plant comprising the vector, seed/pollen and a harvestable part of propagation material from the transgenic plant, a host cell on unclectides transgenic nation anti-GREP anti-Ody which specifically comprising the GREP nucleic acid, an anti-GREP sequence appearing as AREA 197, an anti-GREP sequence molecule consisting of 14.

To nuclectides transgenic to the GREP signature nuclectide sequence appearing as AREA 197, an anti-GREP anti-Ody which specifically recognises a GREP or is fragment, a method for altering growth and/or activity of a plant cell/storage organ comprising modulating the recognises a GREP or its activity of a GREP or the rice growth regulating peptide osps. is an enthod for downregulating levels of a GREP or Osps. or organs or deatures which comprises isolating alleles for a GREP or osps. or organs or deatures which comprises isolating alleles for a GREP or organs and electing an allele with desired features which comprises isolating alleles for a GREP or osps. organs or organs or deatures. Or organs or organs or organs or deatures. Or organs or organs or organs or organs or deatures. Or organs or organs or organs or organs or deatures which comprises isolating alleles fo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell:cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL1016-ABL30511), expressed DNA sequences (ABL01840-ABL6175) and the encoded proteins (ABB7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

The invention relates to a modified enzyme of a non-haeme iron (II) dependent family of oxygenases and oxidases which renders the enzyme dependent on bicarbonate for activity. The invention also related to a method for producing penicillin G or V comprises employing a modified enzyme, particularly isopenicillin N synthethase (IPNS), in either an organism or a cell-free system, under the control of bicarbonate. The modified enzymes are IPNS, deacetoxycephalosporin C synthetase (DACS) and deacetylcephalosporin C synthetase (DACS). The method is useful for producing antibiotics, particularly penicillin G or V. The method is useful for making organisms useful for making an antibiotic dependent on bicarbonate to make the antibiotic. The present sequence is Streptomyces cattleya modified isopenicillin N synthetase showing an Arg211 in place of Glu211
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Method for producing antibiotics, particularly penicillin G or V, comprises employing a modified isopenicillin N synthethase, in either an organism or a cell-free system under the control of bicarbonate.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-! FUNCTION: In eubacteria ppGpp (guanosine 3'-diphosphate 5-'diphosphate) is a mediator of the stringent response that coordinates a variety of callular activities in response to changes in nutritional abundance. This enzyme catalyzes the formation of pppGpp which is then hydrolyzed to form ppGpp (By
                                                                                                                                                                                                                                                                                                                                                                   CATALYTIC ACTIVITY: ATP + GTP = AMP + guanosine 3'-diphosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Lorbiecke R., Sauter M.M.; "Comparative analysis of PSK peptide growth factor precursor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TIGRFAMS; TIGR00691; spoT_relA; 1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

Novel antibody that specifically binds to mammalian IgE epitope, useful for testing an allergen reactivity of IgE sample, detecting mammalian IgE or treating asthma or anaphylactic shock.

Example 6; Page 9; 14pp; English.

The present invention relates to a novel monoclonal antibody (1) that specifically binds to a mammalian IgE epitope, where the epitope is between amino acids 145-166 or 156-374 of mammalian IgE, e.g. dog IgE. (1) is useful for testing an allergen reactivity of an IgE sample. The allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut and corn allergens. The sample is a biological sample collected from a dog, cat or horse. (1) is also useful for detecting mammalian IgE and for treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal antibodies recognise epitopes on canine IgE corresponding to amino acid residues 357-371 (ADR10601) and 146-162 (ADR10609) respectively of the

The products of the invention are capable of neutralising IgE activity and have antiallergic activity. The polyuncleotides of the invention are used to produce recombinant IgE (II), and this is used to raise specific monoclonal antibodies (MAb). Both (II) and MAb are useful for diagnosis, particularly of allergy in horses, and MAb can also be used for treatment of allergies. (I) make possible production of isotype-specific antibodies, important for precise evaluation of the immune response. This
cannne IgE epsilon-chain. Recognition of epsilon-chains from IgE from cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and 3.76 were observed to have good cross-reactivity with the epsilon-chain of IgE from cat and horse, but did not exhibit cross-reactivity with either pig or human epsilon-chains of IgE. The present sequence is the horse IgE 5.91 recognition site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequence encoding part of an equine immunoglobulin G, useful for paring isotype-specific antibodies for diagnosis and treatment of

The products of the invention are capable of neutralising IgE activity and have antiallergic activity. The polymucleotides of the invention are used to produce recombinant IgE (II), and this is used to raise specific monoclonal antibodies (MAD). Both (II) and MAD can also be used for diagnosis, particularly of allergy in horses, and MAD can also be used for treatment of allergies. (I) make possible production of isotype-specific antibodies, important for precise evaluation of the immune response. This sequence represents a fragment of the equine IgE heavy chain constant region C-epsilon allotype b (Ceb), used in the method of the invention for IgE-isotype recombinant immunoglobulin production
sequence represents a fragment of the equine IgE heavy chain constant region C-epsilon allotype a (Cea), used in the method of the invention for IgE-isotype recombinant immunoglobulin production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA sequence encoding part of an equine immunoglobulin G, useful for preparing isotype-specific antibodies for diagnosis and treatment of allergy in horses.

The invention relates to isolated Equine Protozoal Myeloencephalitis

(EPM) marker polynucleotide sequences selected from any of the fully
defined sequences (SEQ ID Nos 1, 3, 5, 7, 8, 10, 12, 14, 16, 17, 18, 20,
22, 24, 26, 27, 28, 30, 33.4-50, 52, 54, 55, 56, 57, or 422) in the
Specification. The EPM polynucleotide sequences encode EPM polypeptides
(SEQ ID Nos 2, 4, 6, 9, 11, 13, 15, 19, 21, 23, 25, 29, 31, 33, 51, 53,
or 58). Also described are: (1) a method of diagnosing the presence of
EPM or Sarcocystis neurona infection in a test subject; (2) a method of
treating, preventing, or inhibiting the development of EPM in a subject;
(3) a nucleic acid construct comprising an EPM marker polynucleotide in
operable connection with a regulatory element that is operable in a host
cell; (4) an isolated host cell containing the nucleotide sequence that
hybridizes under low stringency conditions to the polynucleotide; and (6)
a solid or semi-solid support comprising a nucleotide sequence that
hybridizes under low stringency conditions to the polynucleotide; and
a solid or semi-solid support comprising a least one probe immobilized
or it. The EPM marker polynucleotides, probes, EPM marker polypeptides,
or antigen-binding molecules that are immuno-interactive with the EPM
marker polypeptide, are useful for diagnosing the presence of EPM in a
cubject. The EPM marker polynucleotides and polypeptides are also useful
for the diagnosis, monitoring, and treatment of EPM in affected animals.
This sequence represents an EPM marker polypeptide.

The invention relates to a method of determining the presence or degree of a physiological response to stress or a related condition in a test subject comprising detecting in the test subject aberrant expression of at least one stress marker gene given in the specification. The invention also relates to a method of treating, preventing or inhibiting the development of stress in a subject, an isolated stress marker polymucleotide, a mucleic acid construct comprising a stress marker polymucleotide in operable connection with a regulatory element that is polymucleotide in operable connection with a regulatory element that is coprable in a host cell, an isolated host cell containing the construct, a probe comprising a nucleotide sequence that hybridizes under a least construction appoint comprising at least one probe immobilized on it. The stress marker polymucleotides, probes, stress marker polymeliaes, probes, stress marker polymeliaes, probes, stress marker polymeliaes, probes, stress marker polymeliaes, probes, stress mannfacture of a kit for diagnosing the presence of a physiological response to stress in a subject. The methods are useful for the mannfacture of a kit for diagnosing the presence of a physiological response to stress in a subject. The physiological response to stress is selected from physical stress, mood disorders, anxiety disorders, inflammation, pain, chronic fatigue syndrome, stress in immunodeficiency virus (filty) infections, neurodegenerative diseases, amyotrophic lateral sclerosis, a decrease in immunosubpression, hemorragic stress, stress, stress induced headache, cancer, human immunosuppression, hemorragic stress, stress, stress in immunosubpression, hemorragic stress, stress, stress in immunosubpression, endergene of immunosupression, hemorragic stress, stress, stress induced to immunosuppression, hemorragic stress, stress, stress induced between the immunosuppression, hemorragic stress, stress, stress, stress induced to manner in immunosuppression, entergates of immunosuppression, he

elicit in a mammal a CTL response to naturally processed and presented 1gE peptides. C1-3 have antiallergic, antiasthmatic, immunosuppressive, vasotropic, dermatological, antiinflammatory and cytostatic activities, and can be used as inducers of a CTL response against 1gE, and in vaccines. C1-3 can be used for modulating an IgE-mediated condition in a mammal. C1-3 are useful for modulating an IgE-mediated condition such as IgE-mediated atopic hypersensitivity condition, IgE-mediated condition auseful for treating atopic hypersensitivity condition, IgE-mediated non-atopic useful for treating atopic hypersensitivity conditions (such as allergic rhinitis, allergic asthma, food allergies, or atopic dermatitis), non-atopic hypersensitivity conditions (such as anaphylaxis, and urticaria hives). The present sequence represents an IgE heavy chain amino acid sequence, which is given in an example from the present invention

I

The present invention describes a method (MI) for identifying peptides that induce cytotoxic T-lymphocyte (CTL) response against immunoglobulin B (IgB), comprising providing a test peptide (T) suspected of being able to bind to major histocompatibility complex (MHC) class I molecule, and evaluating (T) for ability to elicit in a mammal a CTL response to induces such a response is identified. Also described are compositions: (C1) comprising at least one immunogenic peptide (I) identified by (MI); (C2) comprising at least one isolated polynuclectide encoding (I); and (C3) comprising antigen-presenting cells that recognise at least one (I) where C1-3 are able to bind to at least one MHC class I molecule and to

protein

```
The invention relates to an immunogenic composition comprising an isolated polypeptide having an amino acid sequence that is at least 80% identical to 6 (81-86), 15 amino acid peptide sequences derived from antibody that specifically binds to equine immunoglobulin E (the composition induces production of an antibody that specifically binds to equine immunoglobulin (Ig)E), the six polypeptides are not explicitly identified in the specification. Also included are a composition comprising an antibody that specifically binds to a polypeptide at least 80% identical to (S1)-(S6), an antibody that specifically binds to equine IgE made by the process of immunising an antibody that specifically binds to equine IgE (involving immunising an antibody that specifically binds to equine IgE (involving immunising an antibody confirm of further comprising an isolated polypeptide (the animal with a composition further comprising an isolated polypeptide (the animal with a definition of the polypeptide is at least 80% identical to (S1)-(S6)), and collecting antiserum from the animal) and a kit for detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunogenic composition comprising an isolated equine immunoglobulin E polypeptide that induces production of antibodies which specifically bind to equine immunoglobulin E.
                                                                                                                                                                                                                                      Horse immunoglobulin E, IgE, heavy chain immunogenic peptide P4.

```
for detecting specific binding of the antibody to equine ISE. The antibody is useful for detecting equine ISE protein in a biological sample (serum) which involves contacting the sample with the antibody thus forming an antigen/antibody complex, and detecting the presence or absence of the antigen/antibody complex, the antibody and antigen are immobblised on a solid surface. The antibody is labelled such that the complex can be detected. The complex is detected using a second labelled antibody. The peptides are useful for generating antibodies specific for ISE which can serve as a diagnostic test for allergy. The present sequence is a Horse immunoglobulin B, ISE, heavy chain immunogenic peptide from the early portion of the C4 region.

genome of Legionella pneumophila Paris strain and derived ypeptides, useful for detection or identification of the strain and treatment and prevention of infections. polypeptides, New for

Claim 3; SEQ ID NO 4054; 660pp; English.

The invention relates to an isolated or purified nucleotide sequences (I) from Legionella pneumophila Paris strain. (I), and their related sequences or fragmence, are useful as primers and probes for detection and amplification, including differentiation between the Paris and Philadelphia strains of Legionella pneumophila and to prepare recombinant (hybrid) polypeptides (II). (II) are also useful for preparation of specific antibodies (Ab), also used for detection/identification of Legionella, and some (I), specifically those involved in synthesis of surface proteins, are targets for identification of inhibitors. (II), or vectors that contain (I), are useful as vaccines and immunogenic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention discloses a compound comprising arginine deiminase (ADI)

covalently bonded by a linking group to polyethylene glycol (PEG) having

a total weight average molecular weight of about 1000-50000. Also

disclosed is a method for enhancing the circulating half life or the

tumouricidal activity of arginine deiminase by modifying the arginine

deiminase by covalently bonding the arginine faciminase by a linking group

to PEG. Normal cells can synthesise arginine from circulline in a 2 step

process catalysed by argininosuccinate synthase and argininosuccinate

lyase. In contrast, many cancerous cells do not express argininosuccinate

synthase and are, therefore, auxotrophic for arginine. Arginine deiminase

catalyses the conversion of arginine to circulline and be used to

catalyses the conversion of arginine to circulline and be used to

catalyses the conversion of arginine to circulline and patient, or

contraining a tumour and as melanoma, hepstoma or sarcoma in a patient, or

for treating and inhibiting metastases in a patient. When compared to

native arginine deiminase the compound retains most of its enzymatic

cativity, is far less antigenic, has a greatly extended circulating half-

life, and is much more efficacious in the treatment of tumours. The

sequence presented is the Qiardia intestinalis arginine deiminase gene,

catalyser. (Updated on 06-AUG-2003 to correct OS field.)

The invention relates to inhibiting the replication of one or more viruses in an individual and involves administering to the individual accomposition comprising an arginine deaminase bonded to polyethylene glycol. The method is useful for inhibiting replication of one or more viruses e.g. hepatitis virus (hepatitis cirus-lb), in an individual, where the arginine deaminase is derived from Mycoplasma e.g. M. arginini, M. hominis, M. arthritidis and its combination. It is useful for treating an individual who is suspected of having been exposed to one or more viruses; for modulating nitric oxide levels in an individual. The method is also useful for treating a tumour and inhibiting replication of one ore hepatoma. The tumour is melanoma, sarcoma, or hepatoma. The tumour is hepatocellular carcinoma. The method is also useful for improving liver function in an individual. The present useful for improving liver function in an individual. The present
                                                 Inhibiting replication of viruses in individual, involves administering composition comprising arginine deiminase bonded to polyethylene glycol, to individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Dog IgE epitope recognised by monoclonal antibody 5.91, SEQ ID 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

                                                                                                                                                                                                                                                                                   The present invention relates to a novel monoclonal antibody (I) that specifically binds to a mammalian IgE epitope, where the epitope is between aminon acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. (I) is useful for testing an allergen reactivity of an IgE sample. The allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut and corn allergens. The sample is a biological sample collected from a consolidation or anaphylactic shock. The 5.91 and 3.76 monoclonal creating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal creating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal creating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal creating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal canine IgE epsilon-chain. Recognition of epsilon-chains from IgE from cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and 3.76 was examined. Both 5.91 and 6.76 IgE from cat and horse, but did not exhibit cross-reactivity with the epsilon-chain of IgE. either pig or human epsilon-chains of IgE.

antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific canti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of 198, and so preventing triggering and activation of mast cells and basophils and downregulation of 198 synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against 198-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. CC conjugates of (I) that include a promiscuous T helper cell epitope. (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAYY9994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                          New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy.

                                                                                                                                                                                                                                                                                                                    baving an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties.

The recombinant DNA construct is useful for improving plant properties.

The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of photosynthesis or by prophyrus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan condition, improved lignin production or improved galactomannan scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                               New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                     The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polymucleotide encoding a polymeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant

Isolated canine IgE heavy chain constant region DNA - useful to develop products for treatment of canine allergies and for immunomodulation in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This polypeptide is encoded by exons 1-4 (see AAT79278) of canine IgE heavy chain constant region (epsilon) genomic DNA. Another polypeptide, comprising the exon 5 and 6 product, is given in AAW23068. Recombinant peptides encoded by exons 1-6 can be produced in eukaryotic or prokaryotic cells. Such peptides, and antibodies raised against them, a used in methods to treat the manifestation of allergy in dogs, e.g. to treat Type I immediate hypersensitivity, and for immunomodulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .;
